

Abstract of the Disclosure

A fruit/vegetable slicer for slicing the food stuff, wherein it comprises: a stand suitable
5 to be installed at the bottom to support the upper composite parts, comprising a
rotational crank, a movable blade frame and a housing, wherein a food stuff pressing
plate is inserted in the through hole of the housing. In order to slice the fruits and
vegetables, firstly the food stuff pressing plate is taken out and the food stuff is put into
the housing through hole, the food stuff is constantly being pressed down and the
10 rotational crank is continually being rotated, when the rotational crank rotates
clockwise, the movable blade frame reciprocatingly moves laterally such that the food
being pressed stuff is sliced. The fruit/vegetable slicer can be operated very easily,
and the pressed food stuff can be sliced by merely rotating the rotational crank
clockwise and slightly pressing the food stuff pressing plate. Thus the fruits and
15 vegetables can be sliced steadily, swiftly and conveniently, without the user's being in
immediate contact with the blade or causing any unnecessary danger.
